

Data gathering

Sources of Data

A vast amount of historical data can be found in files such as:

- MS Word documents
- Emails
- Spreadsheets
- MS PowerPoints
- PDFs
- HTML
- and plaintext files

Public and Private Archives

CSV, JSON, and XML files use plaintext, a common format, and are compatible with a wide range of applications

The Web can be mined for data using a web scraping application

The IoT uses sensors create data

Sensors in smartphones, cars, airplanes, street lamps, and home appliances capture raw data

Open Data and Private Data

1. Open Data

The Open Knowledge Foundation describes Open Data as "any content, information or data that people are free to use, reuse, and redistribute without any legal,

technological, or social restriction."

2. Private Data

Data related to an expectation of privacy and regulated by a particular country/government

Structured and Unstructured Data

1. Structured Data

Data entered and maintained in fixed fields within a file or record Easily entered, classified, queried, and analyzed Relational databases or spreadsheets

2. Unstructured Data Lacks organization

Raw data Photo contents, audio, video, web pages, blogs, books, journals, white papers, PowerPoint presentations, articles, email, wikis, word processing

documents, and text in general

Example of gathering image data using webcam

Note: Run this snippet using local jupyter notebook

```
In [27]: import cv2

key = cv2.waitKey(1)
webcam = cv2.VideoCapture(0)
while True:
    try:
        check, frame = webcam.read()
        print(check) #prints true as long as the webcam is running
        print(frame) #prints matrix values of each frame
        cv2.imshow("Capturing", frame)
        key = cv2.waitKey(1)
        if key == ord('s'):
            cv2.imwrite(filename='saved_img.jpg', img=frame)
            webcam.release()
            img_new = cv2.imread('saved_img.jpg', cv2.IMREAD_GRAYSCALE)
            img_new = cv2.imshow("Captured Image", img_new)
            cv2.waitKey(1650)
            cv2.destroyAllWindows()
            print("Processing image...")
            img_ = cv2.imread('saved_img.jpg', cv2.IMREAD_ANYCOLOR)
            print("Converting RGB image to grayscale...")
            gray = cv2.cvtColor(img_, cv2.COLOR_BGR2GRAY)
            print("Converted RGB image to grayscale...")
            print("Resizing image to 28x28 scale...")
            img_ = cv2.resize(gray,(28,28))
            print("Resized...")
            img_resized = cv2.imwrite(filename='saved_img-final.jpg', img=img_)
            print("Image saved!")
            break
        elif key == ord('q'):
            print("Turning off camera.")
            webcam.release()
            print("Camera off.")
            print("Program ended.")
```

```
        cv2.destroyAllWindows()  
        break  
  
except KeyboardInterrupt:  
    print("Turning off camera.")  
    webcam.release()  
    print("Camera off.")  
    print("Program ended.")  
    cv2.destroyAllWindows()  
    break
```

Web Scraping

Web scraping, web harvesting, or web data extraction is data scraping used for extracting data from websites. The web scraping software may directly access the World Wide Web using the Hypertext Transfer Protocol or a web browser. While web scraping can be done manually by a software user, the term typically refers to automated processes implemented using a bot or web crawler. It is a form of copying in which specific data is gathered and copied from the web, typically into a central local database or spreadsheet, for later retrieval or analysis.

Web Scrapping of Movies Information using BeautifulSoup

We want to analyze the distributions of IMDB and Metacritic movie ratings to see if we find anything interesting. To do this, we'll first scrape data for over 2000 movies.

Identifying the URL structure

Identifying the URL structure In the image above, you can see that the URL has several parameters after the question mark:

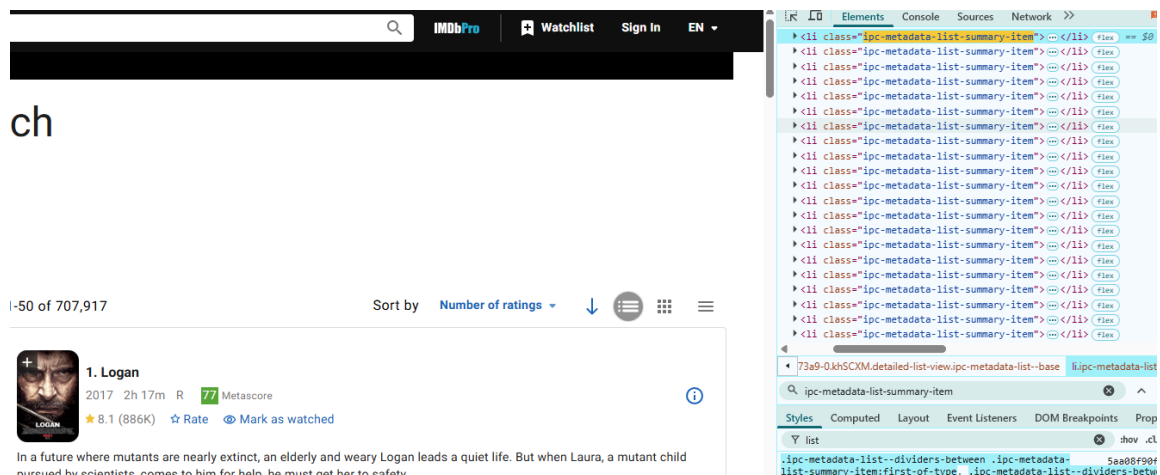

- `release_date` — Shows only the movies released in a specific year.
- `sort` — Sorts the movies on the page. `sort=num_votes,desc` translates to sort by number of votes in a descending order.
- `page` — Specifies the page number.
- `ref_` — Takes us to the the next or the previous page. The reference is the page we are currently on. `adv_nxt` and `adv_prv` are two possible values. They translate to

advance to the next page, and advance to the previous page, respectively

```
In [19]: from requests import get
url = 'https://www.imdb.com/search/title/?release_date=2017-01-01,2017-12-31&sort=num_votes,desc'
agent = {"User-Agent": 'Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/68.0.3422.75 Safari/537.36'}
response = get(url, headers = agent)
print(response)
print(response.text[:500])
```

```
<Response [200]>
<!DOCTYPE html><html lang="en-US" xmlns:og="http://opengraphprotocol.org/schema/" xmlns:fb="http://www.facebook.com/2008/fbml"><head><meta charset="utf-8"/><meta name="viewport" content="width=device-width"/><script>if(typeof uet === 'function'){ uet('bb', 'LoadTitle', {wb: 1}); }</script><script>window.addEventListener('load', (event) => {
    if (typeof window.csa !== 'undefined' && typeof window.csa === 'function') {
        var csaLatencyPlugin = window.csa('Content', {
```

Understanding the HTML structure of a single page

The screenshot shows the IMDb website interface. The top navigation bar includes the IMDb logo, a search bar, and links for Watchlist, Sign In, and EN. The main content area displays a list of movies, with the first one being "Logan" (2017, 2h 17m, R, Metascore 77, 8.1 rating from 886K reviews). The right side of the image shows the browser's developer tools with the Elements panel open, displaying the HTML structure of the movie list. The list is composed of multiple 'ipc-metadata-list-summary-item' elements, each containing a movie title, year, and other details.

Using BeautifulSoup to parse the HTML content

To parse our HTML document and extract the 50 div containers, we'll use a Python module called BeautifulSoup, the most common web scraping module for Python.

In the following code cell we will:

- Import the BeautifulSoup class creator from the package bs4.

- Parse response.text by creating a BeautifulSoup object, and assign this object to html_soup. The 'html.parser' argument indicates that we want to do the parsing using

Python's built-in HTML parser.

```
In [20]: from bs4 import BeautifulSoup
html_soup = BeautifulSoup(response.text, 'html.parser')
headers = {'Accept-Language': 'en-US,en;q=0.8'}
type(html_soup)
```

```
Out[20]: bs4.BeautifulSoup
```

Before extracting the 50 div containers, we need to figure out what distinguishes them from other div elements on that page. Often, the distinctive mark resides in the class attribute. If you inspect the HTML lines of the containers of interest, you'll notice that the class attribute has two values: lister-item and mode-advanced. This combination is unique to these div containers. We can see that's true by doing a quick search (Ctrl + F). We have 50 such containers, so we expect to see only 50 matches:

```
In [30]: movie_containers = soup.find_all('li', class_ = 'ipc-metadata-list-summary-item') #
print(type(movie_containers))
print(len(movie_containers))
```

```
<class 'bs4.element.ResultSet'>
50
```

find_all() returned a ResultSet object which is a list containing all the 50 divs we are interested in.

Now we'll select only the first container, and extract, by turn, each item of interest:

The name of the movie The year of release. The IMDB rating. The Metascore. The number of votes

Extracting the data for a single movie

We can access the first container, which contains information about a single movie, by using list notation on movie_containers.

```
In [37]: first_movie = movie_containers[0]
```

```
In [38]: first_name = first_movie.h3.text
first_name[3:]
```

```
Out[38]: 'Logan'
```

The year of the movie's release

```
In [46]: first_year = movie_containers[0].find('span', class_ = "sc-2bbfc9e9-7 jttF1J dli-ti
```

```
print(first_year)
```

```
<span class="sc-2bbfc9e9-7 jttF1J dli-title-metadata-item">2017</span>
```

```
In [47]: first_year = first_year.text
print(first_year)
```

2017

The IMDB rating

```
In [90]: first_imdb = movie_containers[0].find('span', class_ = "ipc-rating-star--rating")
first_imdb.text[:3]
```

Out[90]: '8.1'

The Metascore

```
In [91]: first_mscore = movie_containers[0].find('span', class_ = 'sc-b0901df4-0 bXI0oL meta
first_mscore = first_mscore.text
print(first_mscore)
```

77

The number of votes

```
In [92]: first_votes = movie_containers[0].find('span', class_ = 'ipc-rating-star--voteCount
first_votes.text[2:-1]
```

Out[92]: '886K'

The script

```
In [98]: # Lists to store the scraped data in
names = []

Data Preparation

I stopped doing the given instructions sir as I don't know how to properly execute them with multiple pages

PART 1 OF MY OWN WEBSCRAPING

I choose a website that List features books that have been turned into movies and are on IMDB's Top 250 List.

These are books that have movies

```
In [115... import requests
from bs4 import BeautifulSoup

url = 'https://www.goodreads.com/list/show/14220.IMDB_250'
agent = {"User-Agent": 'Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.3
response = get(url, headers = agent)
print(response)
```

<Response [200]>

```
In [116... from bs4 import BeautifulSoup
soup = BeautifulSoup(response.text, 'html.parser')
headers = {'Accept-Language': 'en-US,en;q=0.8'}
type(soup)
```

Out[116... bs4.BeautifulSoup

```
In [117... Books = soup.find_all('tr', attrs={'itemtype': 'http://schema.org/Book'}) #Finding
print(type(Books))
print(len(Books))
```

```
<class 'bs4.element.ResultSet'>
```

```
100
```

class_: This is used to find HTML elements with a specific CSS class name.

attrs: This is used when you're targeting any other HTML attribute (like id, href, itemtype, etc.).

Now I will first only select only the first container, and extract, by turn, each item of interest:

- The title of book
- The author.
- The avg_rating.
- The score.

```
In [118... # Lists to store the scraped data
title = []
author = []
avg_rating = []
score = []

# Extract data from individual book container
for container in Books:
    # Title
    title_tag = container.find('a', class_="bookTitle")
    title.append(title_tag.text.strip() if title_tag else "N/A")

    # Author
    author_tag = container.find('span', itemprop='author')
    if author_tag:
        author_name = author_tag.find('span', itemprop='name')
        author.append(author_name.text.strip() if author_name else "N/A")
    else:
        author.append("N/A")

    # Average Rating (just the decimal part)
    rating_tag = container.find('span', class_="minirating")
    if rating_tag:
        raw_rating = rating_tag.text.strip()
        avg = raw_rating.split(" ")[0]
        avg_rating.append(avg)
    else:
        avg_rating.append("N/A")

    # Score
    score_tag = container.find('span', class_='smallText uitext')
    score_link = score_tag.find('a') if score_tag else None
    if score_link and "score:" in score_link.text:
```

```

        score.append(score_link.text.strip().split("score:")[1].strip())
    else:
        score.append("N/A")

# Check List Lengths
print(len(title))
print(len(author))
print(len(avg_rating))
print(len(score))

```

100
100
100
100

```

In [119... import pandas as pd

Books = pd.DataFrame({
    'Title': title,
    'Author': author,
    'Average Rating': avg_rating,
    'Score': score
})
Books.head(3)

```

```

Out[119...

```

	Title	Author	Average Rating	Score
0	To Kill a Mockingbird	Harper Lee	4.26	2,139
1	The Lord of the Rings	J.R.R. Tolkien	4.54	1,971
2	The Wonderful Wizard of Oz (Oz, #1)	L. Frank Baum	really	1,376

Part 2: now that I have a data to clean I will now clean the data

```

In [120... Books.isna().any() # Check if there are empty rows

```

```

Out[120...
Title          False
Author         False
Average Rating False
Score          False
dtype: bool

```

```

In [121... Books.duplicated().sum() #check if there are duplicates

```

```

Out[121... 0

```

```

In [122... Books.info() #checking if the datatypes are correct

```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 100 entries, 0 to 99
Data columns (total 4 columns):
 #   Column          Non-Null Count  Dtype
---  -
 0   Title           100 non-null    object
 1   Author          100 non-null    object
 2   Average Rating  100 non-null    object
 3   Score           100 non-null    object
dtypes: object(4)
memory usage: 3.3+ KB
```

it seems that the data are not in the right data types, I will now convert them into their correct data types

In [123...

```
# don't forget to remove the commas and extra spaces from 'Score' and 'Average Rating'
Books['Score'] = Books['Score'].str.replace(',', '').str.strip() #I added this code
Books['Average Rating'] = Books['Average Rating'].astype(str).str.strip()

# Now convert to numeric
Books['Score'] = pd.to_numeric(Books['Score'], errors='coerce')
Books['Average Rating'] = pd.to_numeric(Books['Average Rating'], errors='coerce')

# Check result
print(Books.dtypes)
print(Books.head(3))
```

```
Title           object
Author          object
